

In the Specification (Paragraph bridging pages 8 and 9):

In the exemplary embodiment of the present invention, at least one of the pins is distinguished from the remaining pins by one or more visual characteristics such as length, color or visual graphics adjacent the pin. The distinguished pin is operative as a king pin which may be used to assist an operator with the task of aligning a polishing platen with the tool. Figure 4, shows an exemplary king pin 64 which is longer than the other pins 38, 32, 66. Figure 1 shows one exemplary embodiment of the present invention where the tool 10 includes two king pins 18 adjacent opposed edges of the tool. In the exemplary embodiment all of the pins extend above the upper surface of the compressible layer when the compressible layer is uncompressed. However, in alternative embodiments, only the king pins may extend above the upper surface of the compressible layer, when the compressible layer is uncompressed.
